Section 1

Qualitative

Problem

University students often struggle to manage assignments, quizzes, and deadlines because they use multiple platforms (WhatsApp, Google Classroom, notes, diary, etc.). Important deadlines are missed, reminders are not reliable, and information is scattered across different apps.

Questions

- How can we help university students track all their assignments and deadlines in one place?
- Why do students miss deadlines when they use multiple apps and platforms?
- How can an app provide clear and reliable reminders for assignments and quizzes?
- How can we design a simple interface that reduces confusion about what is due and when?
- How can we improve students' time management and reduce stress related to academic tasks?

Methods

User Research Method

Purpose: To understand students' real problems.
- Conduct short interviews with 5–10 students
- Or use a simple online survey (Google Form)
- Ask questions like:
  - How do you track assignments?
  - Do you miss deadlines? Why?
  - What features do you want in one app?

Output:
- List of user pain points
- Common problems and needs

Problem Definition Method

Purpose: To clearly define what problem you are solving.
- Analyze research answers
- Write:
  - User Persona (example student profile)
  - Problem Statement
- Example:
  - "Students need one simple place to manage assignments because information is scattered and deadlines are missed."

Output:
- 1–2 user personas
- 1 clear problem statement

Ideation Method (Brainstorming)

Purpose: To generate multiple ideas and solutions.
- Brainstorm features:
  - Dashboard, reminders, calendar, list view, etc.
- Sketch rough ideas on paper or in Figma
- Decide 2–3 different design approaches (solutions)

Output:
- Feature list
- 2–3 solution concepts

Wireframing Method

Purpose: To plan the layout before final design.
- Create low-fidelity wireframes in Figma
- Screens:
  - Home / Dashboard
  - Add Assignment
  - Assignment List
  - Calendar
- Focus on structure, not colors

Output:
- Simple wireframes for main screens

UI Design Method (High-Fidelity Design)

Purpose: To create the final visual design.
- Design clean UI in Figma
- Add:
  - Colors
  - Icons
  - Buttons
  - Typography
- Make 2–3 versions (for multiple solutions)

Output:
- Final UI screens
- Multiple design solutions

Usability Testing Method

Purpose: To check if users can use your design easily.
- Show your design to 3–5 students
- Ask them:
  - Can you add an assignment?
  - Can you find today's tasks?
- Note problems and improve design

Output:
- List of issues
- Improved design version

Solutions

Solution 1: Simple List-Based Assignment Manager
This solution shows all assignments in a single list sorted by due date. Students can quickly see what is due next and add or edit tasks easily. Simple reminders help prevent missed deadlines. This design is best for users who want a clean and easy-to-use interface.

Solution 2: Dashboard Design
This solution uses a dashboard with cards like "Today," "This Week," and "Overdue." It gives students a quick overview of their work and helps them decide what to do first. The visual layout makes task management more organized and less stressful.

Solution 3: Calendar-Based Planner
This solution shows assignments on a calendar so students can see their schedule by date. They can tap a day to view or add tasks. This helps students plan ahead and manage their time better.

Solution 4: Subject-Wise Organizer
This solution organizes assignments by subjects instead of only by date. Students can open a subject and see all related tasks. This keeps work structured and reduces confusion between different courses.

Solution 5: Reminder-Focused App
This solution focuses on strong reminders and notifications for deadlines. Students can set multiple alerts for important tasks. This helps ensure deadlines are not forgotten and reduces stress.
